KeiBerg International, Inc.

The LINE ALERT panel and process effectively acts as a real-time measured guidance system that takes you safely near your underground line.

**One Line Strike
Is Too Many**

KeiBerg offers a leaflet devoted to LINE ALERT™ Panels and Insertion Tools which are described as effectively acting as a real-time measured guidance system that takes excavators safely near existing underground lines. The brochure says Line Alert makes it safer to excavate over an underground line, giving a constant visible guide to the distance from an underground

line. It warns excavator operators if they get near underground lines, creates a safer dig site by virtually eliminating the need to probe. And by reducing the amount of time laborers spend in the ditch, allows potholed/daylighted lines to be backfilled immediately which reduces open-hole hazards. Bruce Waite, 204-480-1845, www.keiberginc.com.
